Technical Prerequisites

Cegid Retail Y2 Ed. 2019 On Demand

Make more possible

10/02/2020 version
Foreword

This document describes the technical prerequisites associated with the Cegid Retail Y2 On Premises solution, installed and running on the Customer’s site. This solution is released by Cegid.

This document covers the technical issues relating to various servers, telecommunications and networking, workstations and peripheral devices. If these technical prerequisites are satisfied, the correct operating of the Cegid Retail Y2 On Premises solution will be ensured. Cegid shall not be held responsible for any issues resulting from the malfunctioning of the application if these prerequisites have not been respected.

In the case of concurrent use of other Cegid applications, the Customer must ensure that all recommendations common to all the offers proposed are effectively met. For customized advice, please contact your sales consultant.

After testing, a customer may decide that a configuration that does not respect these prerequisites, however, meets his needs. If a bug is reported to the Help Desk, the latter will intervene only if the anomaly can be reproduced by the client in an environment meeting the prerequisites.

Remark

Prerequisites for Cegid Retail Intelligence, Demand Forecasting and Sourcing Optimization are described in dedicated documentation and are therefore not discussed in this document.

Please note that the management of backups is supported by the Customer according to the backup tools and methods he uses. During the installation, Cegid will provide all necessary information regarding the data to be backed up and the precautions to be taken during the backup and restore procedures.

Cegid does not support a configuration based on third-party software (operating system, database, etc.), if the latter is not supported by its editor (Microsoft, Oracle...)

The end of support dates for the main third-party software solutions used in the Cegid offer and edited by Microsoft are referenced in the Appendices of the following document under the title: “Microsoft Support Information.”

Legal notices

Permission is granted under this Agreement to download documents held by Cegid and to use the information contained in the documents for internal use only, provided that: (a) the copyright notice on the documents remains on all copies of the material; (b) the use of these documents is for personal and non-commercial use, unless it has been clearly defined by Cegid that certain specifications may be used for commercial purposes; (c) the documents will not be copied to networked computers or published on any type of media, unless explicitly authorized by Cegid; and (d) no changes are made to these documents.

## Software

| .Net Framework (6) | 4.5.2 | 4.7.2 or later |

---

(1) Elements to increase according to analyses carried out (operating system, number of users, and number of used databases, etc.) We recommend dedicating the database engine to the Cegid solution to avoid the following conflicts:

- Incompatibility between the different choices for database configurations
- No control of performance linked to the load arising from another application
- Changes in database versions that may occur at different moments
- Heterogeneous maintenance procedures (for example backup procedures)

(2) Cegid has tested and supports SQL Server 2012 and 2014 on Windows Server 2012 R2.
(4) SQL Server must be deployed in the same language as Windows Server
   (By exception, SQL Server EN can be deployed in various localized Windows Server versions.)
(5) CI_AS (Case Insensitive – Accent Sensitive). Collation must be case insensitive (CI) and accent sensitive (AS).
(6) Required for Cegid Database Maintenance (CDM). The "Client Profile" version is sufficient, but the "Full" version can be used too.
(7) Cegid has tested and supports SQL Server 2016 on Windows Server 2016
2. **Business Application Server - Internet Information Services**

This server is always installed on a local secure network in the customer’s datacenter.

Applications never connect directly to the business application server, but systematically access the distribution server which is an endpoint of the TLS connection and on which the SSL encryption certificate will be deployed. Thus, only one certificate will be required, even if other IIS application servers are added later.

**Important**

Business application server(s) and reporting and scheduled task server(s) must be in the same Active Directory domain (constraint linked to the use of MSMQ queues.)

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

(1) Elements to increase according to analyses carried out (operating system, number of users...)

To qualify with your technical presales consultant.

(2) The business application servers within a same "server farm" must have the same version.
3. REPORTING AND SCHEDULED TASK SERVER

This server is always installed on a local secure network in the customer’s datacenter.

**Important**

Business application server(s) and reporting and scheduled task server(s) must be in the same Active Directory domain (constraint linked to the use of MSMQ queues.)

### Business Application Server

</tbody>
</table>

#### Software

- .Net Framework: 4.5.2, 4.7.2 or later

(1) Elements to increase according to analyses carried out (operating system, number of users...):

To qualify with your technical presales consultant.

(2) Storage capacity available for workspace, OS excluded

Role provided by the server and described in this chapter may also be provided by other solutions available on the market (e.g. F5 solutions – www.f5.com.)

An analysis with the help of Cegid is required to validate the server replacement by this type of solution.

This server interleaves between the business application servers and a Cegid application running on a user device. The server will act as:

- A load balancer between several application servers
- Ensure session affinity, if necessary
- And be the endpoint of the secure TLS connection with client workstations. Therefore, the SSL encryption certificate will be deployed on this server, regardless of the number of IIS business application servers.

Depending on the network topology and on how client workstations do access the application server farm, there may be several ARR servers (e.g. one server for accesses from the private network and one server for a DMZ with Internet accesses.) Each ARR server should have the appropriate SSL encryption certificate (from a certification authority recognized on the market for Internet accesses, generated by Active Directory for accesses from a private network) to ensure the TLS 1.2 security level with client applications.

### Distribution server

<table>
<thead>
<tr>
<th>Hardware and Components</th>

<td>4.7.2 or later</td>
</tr>
<tr>
<td>TCP ports</td>
<td>443 (^{(4)})</td>
<td>443 (^{(4)})</td>
</tr>
</tbody>
</table>
(1) The Customer is responsible for securing their DMZ and the resources that are exposed there. Therefore, he must implement any required means to protect the access to the distribution server, especially from potential external attacks. Cegid’s services teams may support the customer in implementing some measures (security devices…) to optimize the security level of a solution of that type.

(2) A second network card is required once the ARR platform is doubled, for example to respond to scenarios about fault tolerance of this feature.

(3) The distribution servers within a same “server farm” must have the same version.

(4) TCP port 443 is used for SSL/TLS communications (non-modifiable port.) For more details about certificates, refer to the appendices in this document.
5. WORKSTATIONS (DESKTOPS, LAPTOPS, TERMINALS...)

An “Administrator” access right is required to install a Cegid application. Minor updates and the later use of the application require usual standard rights.

<table>
<thead>
<tr>
<th>Windows PCs</th>
<th>Hardware and Components</th>

<td>4.5.2</td>
<td>4.7.2 or later</td>
</tr>
<tr>
<td>Monitor</td>
<td>12”</td>
<td>15” or larger</td>
</tr>
<tr>
<td>Display resolution</td>
<td>1024*768</td>
<td>1680*1050 or higher</td>
</tr>
</tbody>
</table>

(1) Elements to increase according to analyses carried out (operating system, number of local applications...)
(2) For all new clients, PosReady 7 or higher. Do not forget to consider the Microsoft’s end of support as Cegid's supports depends on Microsoft’s (see “Support Information for Microsoft Products”)

**Note**: Do not mix up OPOS manufacturers for device operation.

An identification and authentication process allows users to connect to Cegid Retail Y2 in a secure manner. This mechanism requires a recent version of the browser.

On POS READY 7, Internet Explorer 11 minimum is required.

**Note**: installing Internet Explorer 11 requires to be an administrator of the workstation.
7. TERMINALS FOR CEGID RETAIL CATALOGING/CLIENTELING/SHOPPING

An “Administrator” access right is required to install a Cegid application. Minor updates and the later use of the application require usual standard rights.

<table>
<thead>
<tr>
<th>Hardware and Components</th>
<th>Minimum</th>

<td>1680*1050 or higher</td>
</tr>
</tbody>
</table>

<sup>(1)</sup> Elements to increase according to analyses carried out (operating system, number of local applications...)

**Certified Receipt Printers**

EPSON printers are generally supported and the following are certified:

- The EPSON TMH 6000 IV printer (with WiFi or Ethernet modules.)
- The EPSON TM 88 V and VI printers (with WiFi or Ethernet modules.)
- The EPSON P60 II printer (with WiFi module)
- The EPSON TM-m30 printer (with WiFi module)

Printers will operate in mobility mode, if you implement a WiFi network or a local network in the store.
8. PERIPHERAL DEVICES FOR CEGID RETAIL MOBILE POS

Communications
The devices communicate only via the WiFi network.

Certified Apple Devices – Cegid Retail Mobile POS

<table>
<thead>
<tr>
<th>Hardware</th>
<th>iPod TOUCH 5/6</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>iPhone 6 / 6S / 6S Plus / SE</td>
</tr>
<tr>
<td></td>
<td>iPhone 7 / 7 Plus or later</td>
</tr>
<tr>
<td></td>
<td>iPad Mini 2/3/4</td>
</tr>
<tr>
<td></td>
<td>iPad Air / Air 2 / 5</td>
</tr>
<tr>
<td>Cegid Retail Mobile POS V4 &amp; V5</td>
<td>iOS 8 minimum</td>
</tr>
<tr>
<td></td>
<td>iOS 9.3 minimum</td>
</tr>
</tbody>
</table>

The following cases can be used with these devices:
- Ingenico iSMP Companion for all devices
- Ingenico iCMP for all devices
- Linea-Pro 5 for iPod 5 and iPhone SE only
- Honeywell Captuvo SL22 for iPod 5 and 6 only
- Honeywell Captuvo SL42 for iPhone 5 / SE / 6 / 6s / 6 Plus /6s Plus only (various Captuvo models depending on the size of each device)

The Ingenico cases, iSMP and iCMP, require the use of the centralized transaction management solution from Ingenico called AXIS.

The Verifone Payware cases require the use of the centralized transaction management solution called ADYEN.
- Verifone Payware E315 for iPod Touch
- Verifone Payware E355 for all devices
• Verifone Vx690 for all devices

Certified Receipt Printers

These printers are certified:

• The EPSON TMH 6000 IV printer with WiFi or Ethernet modules.
• The EPSON TM 88 V printer (with Wi-Fi or Ethernet modules.)
• The EPSON P60 II printer (with WiFi module)
• The EPSON TM-m30 printer (with WiFi module)

Printers will operate if you implement a WiFi network or a local network in the store.
9. Peripheral Devices for Cegid Retail Mobile Inventory

This chapter concerns the mobile application for managing inventory counts and documents in batch mode.
As Windows Embedded CE 6 is no longer supported by Microsoft since April 10, 2018 (extended support), the use of this software package is the responsibility of the user.
Please note: This chapter concerns the mobile application for managing inventory counts and documents in connected mode.

Communications

Inventory Tracking works autonomously with regular connections to the Y2 database for retrieving different information:

- Product data
- User rights
- Store transactions to perform

Two communications modes are available:

- Wired connection using a dock with network access
- WiFi connection

Android Certified Devices

The software installed on the PDA consists of an APK copied to the mobile device and then installed with native Android tools.

<table>

</tbody>
</table>

Minimum memory: 2 GB RAM including 1 GB available
Minimum storage 16 GB

IOS Devices

Inventory Tracking V2 is compatible with the following materials:

- Iphone 6 et +
- 64-bit processor
11. Printers & Peripherals

The Cegid applications use the printing infrastructure of the Windows environment. We have to ensure that the print devices do have the certified printing drivers, especially on 64x platforms for an efficient support of the used operating systems (for clients and servers).

Instead of exchanging directly with each device, the POS terminal communicates with a generic multi-device connector called CPOS. Customers or partners can develop their own drivers to connect their specific devices.

The CPOS connector does not concern:
- Network printers
- Label printers
- Barcode readers
- Inventory terminals

Please note:
In general, the unitary compliance of each device with the prerequisites does not guarantee that the system consisting of an assembly of hardware, OS, software and multiple devices is either functional, or even optimal. This assembly will have to be tested within the project and validated by the project team on the basis of the usage scenario.

Tips:
Do not mix up OPOS manufacturers.
As the serial port is becoming obsolete, focus on the USB interface.
Receipt Printer (except fiscal printer)

There are two operating modes:

- Via a CPOS driver provided by Cegid to communicate with EPSON and compatible printers.
- Via OPOS drivers provided by other vendors (i.e. HP or IBM.)

Customer Display

There are two operating modes:

- Via a CPOS driver provided by Cegid to communicate with EPSON and compatible displays.
- Via OPOS drivers provided by other vendors (i.e. HP or IBM.)

Cash Drawer

There are two operating modes:

- Via a CPOS driver provided by Cegid to communicate with EPSON and compatible cash drawers.
- Via OPOS drivers provided by other vendors (i.e. HP or IBM.)

Barcode Scanner

Handheld barcode readers: all models connected in USB mode or as ‘keyboard/control unit’ interface (Wedge mode) with the “CR/LF” sequence applying automatically after the reading of a barcode.

Note: the keyboard configuration may affect the interpretation of barcodes.

Magnetic Card Reader

HP models: External MSR device in USB mode driven by the OPOS layer (OPOS version 2.62) + the CPOS layer.
MSR device integrated with the HP AP5000 and HPRP9G1 POS terminals driven by the OPOS layer + the CPOS layer.

Document Reader

3M model: "QS 1000" reader driven by the CPOS layer with software components "3M™ Page Reader SDK" in version 3.1.10.

Fingerprint Reader

U.are.U model: "4000B" device driven by the CPOS layer with the software components "DigitalPersona One Touch for Windows SDK" in version 1.6.1.
**U.are.U model:** "4500" device driven by the CPOS layer with the software components "DigitalPersona One Touch for Windows SDK" in version 1.6.1.

**EFT Drivers**

Y2 uses EFT solutions using CPOS drivers. These solutions are specific to every country and EFT requirements. Cegid provides CPOS driver templates that can be:

- Used in current condition in some cases
- Adapted in other cases
- Serve as templates to develop others

To validate that a driver already exists for the solution you are using in your scope of use, please contact your sales consultant.

**Other Printers**

For other types of printers, especially network printers, rewritable and label printers, please contact your sales consultant.
12. **Country Packages**

The concept of “Country Packages” includes many elements about deployment specifics in different countries including the following information:

- Translation management
- Tax management
- For some countries, specific reports and receipt formats
- For some countries, management of fiscal references
- For some countries, integration of local components such as:
  - Specific functional components
  - Packaged exports
  - Tax printers or components
- For some countries, software certification

Please refer to documentation dedicated to “Country packages” to get information about the technical requirements about their specific components.
13. Networking

ADSL versus SDSL

For Web Access HTTPS solutions, the store needs only a simple ADSL subscription.

For a great number of connections (local for navigating and e-mailing, and remote on the business application server(s)), the Headquarters should focus on the use of two separate Internet subscriptions, one for Internet navigating and the e-mailing in the Headquarters, and the other dedicated to business connections.

In this case, the use of Internet in the Headquarters does not have a negative impact on cashing operations in the store.

The latency for Internet accesses is a very important concept for the use of the Cegid Retail Y2 solution.

A Round Trip Time superior to 100 ms may alter the user experience of Cegid products. Especially on POS terminals it is necessary to test the target sales process to validate user experience according to the various network performance levels that will be encountered. If need be, the configuration of the sales process can be adapted to the network constraints for some stores.

Average bandwidth stated for the Front Office

On the average 50 kb/s to 100 kb/s per user. Of course, this average should be modulated by the effective use of the Front-Office product.

For some processes, peaks of 100 kb/s can be stated.

Analyses (dashboards) and inventories (with inventory closure) are the most bandwidth consuming processes in the Front-Office.

<table>
<thead>
<tr>
<th>Number of concurrent users</th>

</tbody>
</table>

(*) With the ADSL technology, cuts and slowdowns linked to this technology can be observed.
Average bandwidth stated for the Back Office

On the average 100 kb/s per user. Of course, this average has to be calibrated according to the functional requirements and the effective use of the Back Office product.

Analyses (cubes, dashboards, statistics...), Inventories (with inventory closure), replenishment calculations, imports/exports, and accounting interfaces are the most bandwidth consuming processes on the Back Office.

<table>

</tbody>
</table>

(*) With the ADSL technology, cuts and slowdowns linked to this technology can be observed.

Network protocols to be authorized on the client side and recommended practices

- Network protocol TCP 443 must be allowed out towards Y2 servers.
- Priorization of network protocols is recommended; otherwise you must guarantee not to disturb Y2 network flows by other network usages such as:
  - System updates
  - Software updates
  - Antivirus updates
  - Audio / Vidéo streaming
  - Other “recreational” network usages
- Usage of proxy, cache and/or introspection of network protocols is not recommended.
  - If your company uses proxies, it is advised to exclude the Y2 Server flows from the proxies usage.
- If you use a http proxy, it is advised not have the Y2 Server flows go through these proxies. Some proxy modules can slow the traffic down or generate disconnections:
  - If for example your Y2 Server is hosted through our SaaS solution, the following flows must be excluded for proxy usage: https://*.cegid.cloud
  - In this above SaaS context; the access URLs would be the following: https://9xxxxxx-env.name-retail-on-demand.cegid.cloud/y2 (9xxxxx : client number, Env name. : environment name : ex prod)
- Cegid client support may need in certains situations to remotely access and control a client machine. In order to be able to do this, the site https://www.teamviewer.com must be reachable from client machines.
14. APPENDICES

Terminology Details Concerning Processor Architectures

In documents issued by Cegid, the 64-bit term refers to the architecture – or instruction set - named x86-64, often abbreviated as x64.

This architecture is a 64-bit extension of the conventional Intel 32-bit instruction set x86 and has been introduced by AMD, initially as AMD64. It is supported by all EM64T Intel processors (this acronym designates at Intel the support for this instruction set) and also by all the 64-bit AMD processors.

This architecture must not be mistaken for the one known as IA-64, implemented by the Intel processors of the Itanium family, which is a distinct and incompatible 64-bit architecture. IA-64 and the Itanium processors are outside the Cegid 64-bit scope and are not validated.

Cegid’s Policy Concerning the Application of Microsoft Patches

To correct malfunctioning and/or to improve the support and the security of its products, Microsoft regularly provides updates to be applied to the solutions concerned.

These updates are, among others:

Service Packs/Updates

Set of fixes and changes that apply to a product. These service packs are quite a few (often less than 5 in the whole product lifecycle.) They can be minimums required for installing Microsoft or Cegid solutions, or even third-party applications.

Cegid tests the service packs/updates in conjunction with the applied solutions and publishes information after their release by Microsoft (prerequisite notes identify explicitly versions and levels of service packs supported).

Quality Update

Set of software fixes that corrects security or robustness issues, releases by Microsoft on a supported version/service pack/update (including Extended support for security patches.) These fixes are generally provided on a monthly basis via Windows and/or Microsoft Update.

Microsoft recommends installing these hotfixes (Categorized as important/critical or recommended.) Although Microsoft tests updates extensively for compatibility with deployed applications, there is a risk of undesired edge effects in a particular one environment. Cegid therefore recommends testing the implementation of the Quality Updates in a "pilot environment"
representative of the production environment, and then accepting its deployment in concentric circles on the other machines. (Cegid may propose the implementation of various tools provided by Microsoft to meet this issue.)

**Specific updates**

Unavailable online, these updates are created to address a particular problem. They are delivered by Microsoft exclusively when dealing with an identified problem.

**Support Information for Microsoft Products**

The various products (operating systems, database engines, office products, etc.) mentioned in this document are subject to the support conditions and particularly to the “end of support” conditions.

End dates of extended support for these products (which is the date Microsoft no longer provides security patches) are mentioned below. More detailed and comprehensive information is available:

Microsoft lifecycle: [http://www.microsoft.com/lifecycle](http://www.microsoft.com/lifecycle)

To benefit from the latest technological developments and from the publisher’s support if required, it is important to consider the product lifecycles, as well as a migration towards later platforms supported by the various business solutions.

To ensure the stability of its solutions deployed on the hardware in hundreds of stores, Cegid supports what Microsoft is committed to supporting for 10 years. That’s why for Windows 10, Cegid only supports Windows 10 Enterprise LTSB and LTSC 2019, and not the semi-annual versions of Windows 10 that have only a 18 months support.

Support of Cegid Solutions in Virtualized Environments

Various virtualization solutions on the market are designed to reproduce in virtual environments controlled by “hypervisors”, infrastructures previously implemented with physical resources (servers, storage, network, etc.)

If considering the installation of an application solution, you can assume that sizing (number of processors, memory, disk space...) and installing (OS, database engines, and application solutions, etc.) are similar between in virtualized environments and in a physical infrastructure.

Cegid’s solutions will work with the most common hypervisors on the market. They are tested, in particular on the latest versions of hypervisors from Microsoft (Hyper V) and VMware.

Cegid specifically provides functional and technical support for Cegid applications via various standardized offers.

**Specific recommendations for this type of environment**

- Because of the technologies implemented for the virtualization, but also of the consolidation that often leads to pool multiple virtual servers onto fewer physical
machines, performance may be less than this proposed natively in a non-virtualized configuration. The assessment of performance, therefore, has to be taken into account as a priority for this type of solution. We also recommend checking whether specific rule apply to the licenses from every vendor affected by the solution to deploy in a virtualized environment.

- Not all hardware components are “virtualizable” and sometimes some aspects (advanced graphical features, telecommunications equipment, etc.) are not supported.
- First, it is necessary to ensure that the various elements (operating systems, database engine, etc.) of the solution are supported by their respective publishers in the targeted environment (this is generally the case for the most recent Microsoft products on the most representative hypervisors.)
  - Microsoft’ policy for application support in virtual environments can be viewed at the following address: http://windowsservercatalog.com/svvp.aspx?svvppage=svvpwizard.htm.

SSL Certificates for the Cegid Y2 Product Range

For communications between a user’s workstation and a distribution server, it is necessary to secure the exchange by implementing the relevant encryption using a TLS HTTPS protocol.

The most common cases implemented are the following:

The business application server, the distribution server and the client application (Cegid Retail Y2 Smart Client, Cegid Retail Y2 Cataloging/Clienteling/Shopping, Cegid Retail Y2 Mobile POS or the service-consuming application) are located on the company’s network

To customers that have a Windows infrastructure and that have deployed by their IT teams, the certificate server module integrated with Windows Server, and propagated the certificate of the internal authority to the peripheral devices that run an application of type Cegid Retail Y2, Cegid may provide a documentation describing how to integrate on the concerned servers a certificate granted by this internal authority (see document “HTTPS settings for Y2 solution with IIS.)

The distribution server and the client application (Cegid Retail Y2 Smart Client, Cegid Retail Y2 Cataloging/Clienteling/Shopping, Cegid Retail Y2 Mobile POS or the service-consuming application) are linked together via the Internet:

- In this case (or if the network is less secure and controlled than a corporate network), you really must encrypt data passing through these two ends.
- One simple option consists in using a self-signed certificate (generated on the IIS or ARR server); however, this solution must only be used to realize a template limited to Windows
workstations. This solution does not take into account all the features of the Cegid solution:

- Only Cegid applications of type Smart Client with an available connection period are supported.
- In terms of security, it is easy to generate this type of certificate, but there is no guarantee that a Cegid application will connect to “its server”.
- As with a recent browser accessing a site for which neither its origin, nor the validity of the certificate can be guaranteed, users must confirm each time they connect that they agree to access a server equipped with this type of certificate.

- To improve confidence and productivity for users, the recommended solution, in this context, is to deploy on the servers a certificate issued by a recognized certificate authority. Type and cost of the certificate will depend mainly on:
  - The issuing authority and the confidence it inspires on the market.
  - The peripheral devices and browsers you want to be supported.
  - The lifetime of the certificate from 1 year to 4-5 years.
  - The type of certificate and the controls the authority operates before issuing the certificate. Certificates called “EV” or “Extended Validation” will reassure the users of a site by coloring the address bar in green. To issue such certificates, a large number of controls are performed on the applicant.

Please note:

When using Cegid Retail Y2 Mobile POS, make sure that the certificate really does support client operating systems for mobile devices.

The device being used must also have an up-to-date list of certification authorities and intermediate certification authorities (available via the updating mechanism of the operating system.)

Cegid offers a support service for implementing SSL certificates, given the complexity of such an implementation.
